"Organization of the neurofascin gene and analysis of developmentally regulated alternative splicing,";
J. Biol. Chem. 272:28742-28749(1997).
-I- FUNCTION: Cell adhesion, ankyrin-binding protein which may be involved in neurite extension, axonal guidance, synaptogenesis, myelination and neuron-glial cell interactions (By similarity).
-I- SUBCELIULAR LOCATION: Type I membrane protein.
-I- ALTERNATIVE PRODUCTS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                              entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch).

RT "Expression patterns of L1-family cell recognition molecules L1, CHL1, RT "Expression patterns of L1-family cell recognition molecules L1, CHL1, RT NrCAM, and neurofascin in the mouse brain.";

RT NrCAM, and neurofascin in the mouse brain.";

RT NrCAM, and neurofascin in the mouse brain.";

RT NrCAM, and neurofascin, in the mouse brain which may be completed in neurofascin, and protein which may be involved in neurite extension, anomal guidance, synaptogenesis, cc involved in neurofascin, axonal guidance, synaptogenesis, cc myelination and neuron-glial cell interactions (By similarity).

CC -1- SUBUNIT: Probable constituent of a neurofascin/NRCAM/ankyrin G complex. Associates with the sodium channel beta-1 (SCNIB) and CC complex. Associates with the sodium channel beta-1 (SCNIB) and CC complex. Associates with the sodium channel beta-1 (SCNIB) and CC -1- SUBCELLULAR LOCATION: Type I membrane protein.

CC -1- SUBCELLULAR LOCATION: Type I membrane protein.

CC -1- SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.

CC -1- SIMILARITY: Contains 4 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Query Match

ESSENTIAL FOR NORMAL GROWTH OOF THE HYPPOCAMPAL MOSSY FIBER PROJECTION.

SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.

TISSUE SPECIFICITY: Expressed mostly by neurons comprising limbic-
associated cortical and subcortical regions that function in
cognition, emotion, memory, and learning.

DEVELOPMENTAL STAGE: FIRST DETECTED AT E15-16, AT STAGE E20 IT IS
DETECTED IN PRESUMPTIVE CORTEX, MEDIAL LIMBIC AREAS OF THE
THALAMUS AND HYPOTHALAMUS. IN THE ADULT, IT IS FOUND IN
HYPOTHALAMUS, PERIRHINAL CORTEX, AMYGDALA AND MEDIAL THALAMIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY: Contains 3 immunoglobulin-like C2-type domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SIMILARITY: Belongs to the immunoglobulin superfamily.
                                                                                                   117

through their extracellular immunoglobulin-like domain.";

RI J. Cell Biol. 154:427-434(2001).

CC -!- FUNCTION: Cell adhesion, ankyrin-binding protein which may be involved in neurite extension, axonal guidance, synaptogenesis, compelination and neuron-glial cell interactions. Isoforms 2/3 may be responsible for mediating and signaling axon-glial interaction cluming the early stages of myelination.

C -!- SUBUNIT: probable constituent of a neurofascin/NRCAM/ankyrin G complex. Associates with the sodium channel beta-1 (SCN1B) and conscipring axons as early as postanatal day 5, during the period conscipring axons as early as postanatal day 5, during the period conscipring axons as early as postanatal day 5, during the period conscipring axons as early as postanatal day 5, during the period conscipring axons as early as postanatal day 5, during the period conscipring axonal proteins in close association with CNTNNAP1.

C -I- SUBCELLULAR LOCATION: Type I membrane protein. Isoform 2/3 is

Butterfield Y.S.N., Krzywinski M.I., Skalska U., Smailus D.E.,
Schnerch A., Schein J.E., Jones S.J.M., Marra M.A.;
The Generation and initial analysis of more than 15,000 full-length
the human and mouse cDNA sequences.";
Proc. Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
C.-i- FUNCTION: Cell adhesion, ankyrin-binding protein which may be
the involved in neurite extension, axonal guidance, synaptogenesis,
myelination and neuron-glial cell interactions (By similarity).
C.-i- SUBUNIT: Probable constituent of a neurofascin/NRCAM/ankyrin G
complex. Associates with the sodium channel beta-1 (SCNIB) and
beta-3 (SCN3B) subunits (By similarity).
C.-i- SUBCELLULAR LOCATION: Type I membrane protein.
C.-i- ALTERNATIVE PRODUCTS:

SIMILARITY: Belongs to the immunoglobulin superfamily.
L1/neurofascin/NgCAM family.
SIMILARITY: Contains 6 immunoglobulin-like C2-type domains.
SIMILARITY: Contains 4 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Event-Alternative splicing; Named isoforms-4;
